Project Summary:

This project builds a Clinical Decision Support (CDS) tool to help patients with musculoskeletal conditions to choose between surgery and conservative care.

Issues:

- Clinicians often lack evidence that is specific to patients
- Shared decision making can be time-consuming
- Treatment outcomes vary from patient to patient

Analytics:

- OLS Regression
- Cross-validation to check performance of model

Relevance:

- Helps clinicians provide more personalized treatment
- Supports treatment choices based on what is important to each patient
- Makes shared decision making more efficient and focused

Takehome/Recap:

- Treatment outcomes differ across patients, and using data-driven models help match the proper treatment to the right person
